WARRANTY

We warrant that this product is free from defects in material and workmanship and, when properly used, will perform in accordance with applicable IET specifications. If within one year after original shipment, it is found not to meet this standard, it will be repaired or, at the option of IET, replaced at no charge when returned to IET. Changes in this product not approved by IET or application of voltages or currents greater than those allowed by the specifications shall void this warranty. IET shall not be liable for any indirect, special, or consequential damages, even if notice has been given to the possibility of such damages.

THIS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO, ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE.
WARNING

OBSERVE ALL SAFETY RULES WHEN WORKING WITH HIGH VOLTAGES OR LINE VOLTAGES.
ELECTRICAL SHOCK HAZARD. DO NOT OPEN CASE.
REFER SERVICING TO QUALIFIED PERSONNEL.
HIGH VOLTAGE MAY BE PRESENT WITH HIGH VOLTAGE OPTIONS.
WHENEVER HAZARDOUS VOLTAGES (> 45 V) ARE USED, TAKE ALL MEASURES TO AVOID ACCIDENTAL CONTACT WITH ANY LIVE COMPONENTS:

- USE MAXIMUM INSULATION AND MINIMIZE THE USE OF BARE CONDUCTORS.

REMOVE POWER WHEN HANDLING UNIT.
POST WARNING SIGNS AND KEEP PERSONNEL SAFELY AWAY.

CAUTION

DO NOT APPLY ANY VOLTAGES OR CURRENTS TO THE TERMINALS OF THIS INSTRUMENT IN EXCESS OF THE MAXIMUM LIMITS INDICATED ON THE FRONT PANEL OR THE OPERATING GUIDE LABEL.
NOTE
This instrument may be triggered by the GR 1546 Strobotac® digital stroboscope. Refer to the 1546 Instruction Manual for further information.

* Measured at ½ of peak-intensity points.
** Electrical input to lamp, watt-seconds.
† Measured with silicon photo detector 1 meter from lamp; singleflash beam intensity is 18 x 10^4 candela.

External Trigger: Contact closure or pulse of ≥ + 2 V pk applied to phone jack.

Supplied: Phone plug for input jack, mounting bracket, attached power cord.

Available: 1536 Photoelectric Pickoff with 1531-P2 Flash Delay (available as 1539-Z Motion Analysis and Photography Set), 1537 Photoelectric Pickoff.

Power: 100 to 125 or 195 to 250 V, 50 to 400 Hz, 16 W max.

Mechanical: Metal case with detachable lamp housing. Dimensions (wxhxd): 1539-A, 2.5x8.38x4.13 in. (64x213x105 mm). WEIGHT: 1539-A, 3 lb (1.4 kg) net, 8 lb (3.7 kg) shipping; 1539-Z, 6 lb (2.8 kg) net, 17 lb (8 kg) shipping.

U.S. Patent Number 2,577,508.

DIMENSIONS IN INCHES
1.1 PURPOSE.

The Type 1539 Strobosave is a small, inexpensive stroboscope, in many respects similar to the Type 1531 and Type 1538 electronic stroboscopes. Unlike these conventional stroboscopes, the Type 1539 has no internal oscillator for flashing-rate control. Therefore, it must be triggered by an external device and cannot be used for direct measurement of rotational speeds and some slow-motion studies.

The Strobosave is used for high-speed photography and observation of objects moving at high speeds. For these applications, the instrument is triggered by a contactor, switch, or photocell that is synchronized with the moving object. In some applications, the Strobosave finds limited use as an auxiliary light source in conjunction with the more sophisticated Type 1531 and Type 1538 stroboscopes.

An external trigger signal automatically synchronizes the flash with periodic movement of the object being observed. When used with mechanical or photoelectric synchronizers, the instrument can be synchronized with nonperiodic (varying rpm) motion. When the Strobosave is synchronized with a moving object, the object will appear to stop or stand still. If the flashing rate of the Strobosave differs slightly from the fundamental speed of the moving object, (when the Strobosave is driven by a Type 1531 or Type 1538), the object will appear to move slowly through a complete cycle.

Because of its compact size, the Type 1539 can be built into machines for permanent use. Multiple units, triggered by a common external signal, are used to illuminate larger areas. A socket, for mounting the instrument on a tripod, is provided on the case. The lamp assembly is detachable, thus making it possible to position the light source in otherwise inaccessible areas.

1.2 DESCRIPTION.

The Type 1539 produces a peak light intensity of up to 11 million beam candles when used on the HIGH-intensity range, and up to 18 million beam candles when used for single-flash applications. The Strobosave operates over the same basic ranges, 0 to 25,000 flashes per minute, as the Type 1531 Strobotac.
Several methods are available for synchronization and control of the flashing rate; it can be triggered directly from a switch closure across the input jack, a positive electrical pulse of at least 2-volts peak, or by the General Radio instruments and accessories listed in Table 1-1.

Do not drop the strobotron lamp or lamp assembly. If the lamp is subjected to severe physical impact, the electrode supports (inside the glass envelope) may become deformed and unsatisfactory operation will result. Check the operation of the Stroboslave and replace the strobotron lamp if necessary.

SECTION 2

OPERATING PROCEDURE

2.1 MOUNTING INSTRUCTIONS.

A mounting-bracket assembly is provided for mounting the Type 1539 Stroboslave, or the Stroboslave and the Type 1531-P2 Flash Delay when both instruments are used in combination. See Figures 2-1a and 2-1b. The mounting-bracket assembly consists of a support bracket for the Flash Delay, a mounting bracket for the Stroboslave (for mounting on either a horizontal or a vertical surface), bracket-assembly hardware, two screws (B) for mounting the Flash Delay unit, and one 3/8 inch, 1/4-20 screw (A) for securing the Stroboslave to the mounting bracket.

To mount the instruments on a horizontal surface, proceed as follows (see Figure 2-1a):

a. Nest the Stroboslave feet in the four 9/16" diameter holes in the bracket assembly as shown in Figure 2-1b, and tighten screw (A) securely. If the Flash Delay unit is not to be mounted with the Stroboslave, the bracket-assembly hardware and the support bracket may be omitted.

b. Mount the Flash Delay unit to the support bracket, using two screws (B) as shown.

c. Position the complete assembly in the desired mounting location. Use the four 7/32" diameter holes in the mounting bracket as a template to locate the mounting holes.

d. Mount the complete assembly firmly in position, using lock washers with the mounting screws.

To mount the instruments on a vertical surface, proceed as follows (see Figure 2-1b):

a. Omit the bracket-assembly hardware and assemble the Stroboslave, mounting bracket, and support bracket (as shown in Figure 2-1b), using screw (A).

b. Mount the Flash Delay unit to the support bracket using screws (B) as shown. If the Flash Delay is not to be used, omit the support bracket.
2.2 POWER REQUIREMENTS.

The Type 1539 Stroboslave is normally supplied to operate from a 100- to 125-volt, 50- to 400-cycle line. A LINE switch, located inside the instrument case, is available for easy conversion to 195- to 250-volt operation.

To convert from one line-voltage operation to the other, remove the instrument from the case (refer to paragraph 4.3.3) and position the LINE switch (see S102, Figure 4-1) for the desired setting. It is recommended that the tag supplied with the power plug be marked to indicate the setting of the LINE switch.

2.3 INSTRUMENT TURN-ON.

The following precautions should be observed before the instrument is turned on:

1. Make certain the power source corresponds to the LINE switch setting (refer to paragraph 2.2) before plugging into a power receptacle.
2. The power plug has three terminals. For operator safety, the third pin on the power plug must be properly grounded.

Connect the trigger signal to the INPUT jack of the Type 1539 Stroboslave. Turn the INTENSITY switch to the desired flashing-rate range.

2.4 OBSERVATION OF MOVING OBJECTS.

The Stroboslave is used for observation of objects revolving, or reciprocating, at speeds too fast to follow with the human eye. Trouble-shooting machinery, monitoring the operation of printing presses and weaving looms, and observation of high-speed phenomena in laboratories and classrooms are typical applications. See Figures 2-2, 2-5, and 2-6.

Figure 2-2. High-speed photograph of a textile spindle "frozen" for the camera; the spindle is rotating at a speed of 250,000 rpm, a routine shot with stroboscopic light.
The flashing rate of the Type 1539 is usually controlled by the Type 1531-P2 Flash Delay and Type 1536 Photoelectric Pickoff, by the Type 1537 Photoelectric Pickoff, or by an external switch closure. These trigger devices can be synchronized with motion of the machine or object under observation to trigger the Stroboslave at a predetermined point in the cycle of movement. With the Flash Delay/Photoelectric Pickoff combination, the trigger signal can be adjusted to any desired point in the cycle while the machine or object is in motion, and without changing the setup. With other photocells or switches, adjustment of the observation point in the cycle is accomplished by physically changing the position of the triggering device. Refer to paragraph 2.7 for detailed use of these trigger devices.

2.5 HIGH-SPEED PHOTOGRAPHY.

When using the Type 1539 Stroboslave for taking high-speed photographs, camera shutter speed becomes relatively unimportant and the photographer is able to capture on film the image of fast-moving objects. The light produced by the Stroboslave is a brilliant flash of such short duration, that the moving object is momentarily "frozen" for the camera. See Figure 2-3.

Synchronization of the light flash and the moving object can be obtained with a triggering device. Typical triggering techniques involve the use of fast-acting switches, photoelectric beams, trip wires, etc. Automatic synchronization of camera shutter and flash is available on the Type 1531-P2 Flash Delay (refer to paragraph 2.7.3). The entire system should be checked for proper synchronization before the film is loaded into the camera.

Determining correct film exposure is simplified by the use of a guide number (GN) that relates the lamp-to-subject distance (d) to the camera-aperture setting (f):

\[ f = \frac{GN}{d} \]

The guide number, as determined from Figure 2-3, is used for single-flash applications. When repetitive flashing is required, the guide number must be multiplied by a correction factor (Guide Number Multiplier-K) taken from Figure 2-4.

It is necessary in computing aperture setting to modify the distance measured between the reflector and the subject. The light from the unit must be considered as coming from a point 1.5 feet behind the front of the
Figure 2.3. Guide number versus film speed for Type 1539 intensity settings. Data is for single-flash operation. See Figure 2.4 for correction required for repetitive flashing.

Figure 2.4. Guide number correction (see Figure 2.3) for repetitive flashing with a Type 1539 Stroboslove.

reflector. Therefore, 1.5 feet must be added to the measured distance between the reflector and subject. For example, if this distance is 2 feet, use 3.5 as the number to be divided into the guide number to obtain aperture setting.

The guide numbers shown in Figure 2-3 should be regarded only as a starting point for obtaining correct exposure. Contrast between subject and background, type of film, development techniques, and many other variables should also be taken into consideration. Trial photographs are
most helpful in determining optimum exposure. Follow the film manufacturer's recommendations when processing the film.

For detailed information on the use of the stroboscope for photographic applications, refer to General Radio's "Handbook of High-Speed Photography," which can be purchased for $1.00.

2.6 OTHER USES.

The Type 1539 is sometimes used as an auxiliary light source for applications involving speed measurements and slow-motion studies. In these cases, the Strobosclave merely provides a second source of light that is controlled by a Type 1531 or 1538 stroboscope (see Figure 2-5).

2.7 EXTERNAL TRIGGERING.

2.7.1 GENERAL.

The following paragraphs describe General Radio instruments and accessories that are used to trigger the Type 1539 Strobosclave. For complete specifications, and additional information concerning the operation and use of these instruments, refer to the General Radio catalog and individual instruction manuals normally supplied with these instruments.

2.7.2 USE WITH STROBOTAC TYPES 1531 AND 1538.

The Type 1539 Strobosclave serves as an auxiliary or "slave" light source when used with either the Type 1531 or Type 1538 Strobotac for speed measurements, motion studies (see Figure 2-5), or photographic work.

In general, the Type 1539 produces the same light-intensity output and operates over the same flashing rate ranges as the Type 1531 Strobotac. The Strobosclave can be used with the Type 1538 Strobotac for flashing rates up to 25,000 flashes per minute, however, at higher flashing rates – up to 150,000 flashes per minute with the Type 1538 – the Strobosclave cannot be used.

Figure 2-5.
Vibration test, using a Type 1538 Strobotac and additional light from a Type 1539 Strobosclave.
When used with the Type 1538 Strobotac, the Stroboslave is triggered directly through a Type 1560-P76 or equivalent connecting cable with a phone plug at both ends. When used with the Type 1531 Strobotac, the Stroboslave must be triggered through a Type 1531-P4 Trigger Cable.

2.7.3 USE WITH FLASH DELAY AND TYPE 1536 PICKOFF.

Two very useful accessories for the Stroboslave are the Type 1531-P2 Flash Delay and the Type 1536 Photoelectric Pickoff. See Figure 2-6. The combination of these three instruments makes it possible to synchronize the flash of the Type 1539 with a moving object at any desired point in its cycle of movement.

![Figure 2-6. Observation of an addressing machine in operation, using a Flash Delay and Photoelectric Pickoff to synchronize the Stroboslave flash with the machine cycle.](image)

The Flash Delay is a small, portable, time-delay unit that is used to insert an adjustable delay period between an externally generated trigger pulse (from the Photoelectric Pickoff) and the resulting flash produced by the Stroboslave. The Flash Delay works equally as well for continuous synchronization (repetitive movement) as for single-flash synchronization.

The Type 1536 Photoelectric Pickoff generates electrical impulses from variations in the intensity of light reflected from the object in motion. These impulses are fed to the Flash Delay where they are amplified, delayed, and shaped. The output from the Flash Delay is then used to trigger the Stroboslave. The Type 1536 consists of a light source, an optical system, and a photocell. Power for the photocell and light source is supplied by the Flash Delay unit.

2.7.4 USE WITH TYPE 1537 PICKOFF.

Like the Type 1536 Photoelectric Pickoff, the Type 1537 is used to convert the motion of a moving object into electrical impulses that are used
to trigger the Stroboslave. The Type 1537, however, has no built-in light source and it is used to trigger the Stroboslave directly; no Flash Delay unit is used, and no time delay is available. The photosensitive element, in this instrument, is a silicon light-activated switch.

The Type 1537 has no amplifier and it is designed to look directly at a source of light. A GE #330 lamp (15.1 W), for example, will operate the pickoff at a distance of 1/2 inch; a 40 W lamp will operate the pickoff at a distance of three inches.

Reflected light will also operate the Type 1537, if sufficient light is available and the rotating object has a highly reflective surface. If the surface is not highly reflective, reflecting tape applied to the surface will often reflect enough light to operate the Photoelectric Pickoff.

In cases where the light intensity (reflective or direct) is low, use the Type 1536 Pickoff and the Type 1531-P2 Flash Delay. The amplifier in the Flash Delay provides greater sensitivity.

2.8 TRIGGERING WITH SWITCH OR PULSE.

The Type 1539 can be triggered directly by the closing of a switch connected across the INPUT jack. The resulting short circuit across the input terminals generates a positive-going voltage step which automatically triggers the flash.

If the switch contacts bounce when the switch is closed, multiple trigger pulses will be generated and SCR holdover will result. A 0.01 μF capacitor across the switch contacts will eliminate this problem, but the maximum flashing rate of the instrument will be limited to 10,000 flashes per minute.

The instrument can also be triggered by a positive pulse of at least 2 volts peak, not exceeding a maximum of 500 volts. These pulses must have a rise time faster than 0.07 V/μsec. The Stroboslave will not operate from a sine-wave input.

2.9 TRIGGERING TWO OR MORE STROBOSLAVES.

Two or more Stroboslaves may be triggered by a common external signal when additional light is needed to illuminate a large area.

When the trigger signal is a positive pulse, a simple distribution box is required to divide the incoming signal. The circuit shown in Figure 2-7 will control three Stroboslaves. To control additional units, merely add more sections, as indicated by the dotted line. If this setup is used, the trigger signal must be a positive-going pulse of at least 5 V. The value of R should be 2.2 kΩ and C should be 0.01 μF.

If a switch closure is used, any number of Stroboslaves may be connected in parallel across the switch. In this case, all Stroboslaves can be triggered directly from a single switch closure and none of the components shown in Figure 2-7 are required.

![Distribution circuit recommended for controlling the flash of multiple Stroboslaves with a single, positive-going pulse.](image-url)
PRINCIPLES OF OPERATION

3.1 CIRCUIT DETAILS.

3.1.1 GENERAL.

The Type 1539 Stroboslave consists basically of a power supply, a trigger circuit, and a strobotron tube. Component designators in the following paragraphs refer to the elementary schematic, Figure 3-1, and the complete schematic diagram, Figure 4-4.

3.1.2 POWER SUPPLY.

Power for the strobotron and trigger circuits is furnished by a voltage-doubler power supply with an output of +420 volts and -425 volts, dc. The power transformer T101 is capable of operating on line frequencies ranging from 50 to 400 c/s, and either a 100- to 125-volt or 195- to 250 volt line. The transformer contains a LINE switch S102 for easy conversion to one voltage input or the other.

3.1.3 TRIGGER CIRCUIT.

The flashing rate of the instrument is controlled by an external signal that is connected to the input of the trigger circuit. A switch closure across the input jack generates a positive-going step that triggers SCR Q101. The SCR can also be triggered by a positive pulse. When Q101 is triggered, capacitor C107 discharges through the primary of pulse transformer T801, thus producing the high-voltage pulse necessary to trigger the strobotron.

3.1.4 STROBOTRON CIRCUIT.

The strobotron tube contains two main elements, a cathode and an anode. A discharge capacitor acts as a low impedance source of voltage
across these electrodes. The gas, however, remains deionized (non-conducting) until a pulse of high voltage from transformer T801 is applied to trigger wires interspersed between the two electrodes. This trigger pulse ionizes the gas and causes the energy stored in capacitor C103 to flow through the tube, thus generating an intense flash of white light.

After the strobotron tube flashes, the gas must deionize before the next flash can occur. This deionization time sets the limit on the maximum flashing rate of the instrument. If too high a voltage is applied across the strobotron before it is deionized, an erratic condition (continuous conduction) known as "holdover" will result.

![Diagram](image.png)

**Figure 3.1. Elementary schematic for the Type 1539 Stroboscope.**

3.1.5 EXTERNAL INPUT.

Operation at external input frequencies somewhat higher than those specified will not necessarily damage the strobotron, but operation could become erratic.
